23RD WEEK

TUESDAY

could ask: "What kinds of truths can be known demonstratively?
What is required for knowledge?"

It's astonishing that Aristotle saw this in the 4th century BCE.

Goal of Prior Analytics A

- To determine how every deduction comes about.
- To define a 'route' (hodos) whereby deductions may be found.
- To explain how to transform any given deduction into a deduction 'in the figures'.

Notes

- The Greek word hodos literally means "road" or "path."
- In this context, it means a method or procedure by which ~~the~~ we can move from given premises to necessary conclusions.
- Aristotle is not just interested in the fact that a conclusion follows — he wants to teach you how to find such a conclusion when given some premises.
